Is That Annoying Earwater Feeling Driving You Mad? Here's How to Get Water Out of Your Ear

Ah, the dreaded feeling. You've just enjoyed a refreshing dip in the pool, a relaxing shower, or perhaps even a vigorous workout, and now... that persistent tickle, that muffled hearing, that undeniable sensation of water trapped in your ear. It's not just uncomfortable; it can be downright distracting and, if left unaddressed, can even lead to more serious issues like swimmer's ear. But before you panic and start poking around with questionable objects (please, don't!), let's explore some safe and effective ways to banish that watery intruder.

As a content writer who's personally experienced this watery woe more times than I care to admit, I've experimented with just about every trick in the book. And the good news is, most of the time, getting water out of your ear is a simple process that doesn't require a doctor's visit. So, let's dive in (pun intended!) and get that ear canal clear again.

Why Does Water Get Stuck in My Ear Anyway?

Before we get to the solutions, it's helpful to understand why this happens. Your ear canal isn't perfectly straight. It has a slight curve and is lined with tiny hairs and earwax (cerumen). These natural features are designed to protect your ear, but they can also create little pockets where water can get trapped. When water enters, it can pool in these areas, especially if you have a lot of earwax or if the ear canal is narrow.

This trapped water can create a breeding ground for bacteria and fungi, leading to that dreaded condition often referred to as "swimmer's ear" or otitis externa. Symptoms of swimmer's ear can include itching, redness, swelling, and pain. So, getting that water out promptly is not just about comfort; it's about preventing potential ear infections.

Safe and Effective Methods to Get Water Out of Your Ear

Let's get down to business. Here are the most effective and doctor-approved methods for dislodging that stubborn earwater.

The Gravity and Head Tilt Method (The

Classic)

This is the simplest and often the first thing you should try. It relies on the power of gravity.

1. **Tilt Your Head:** Lean your head to the side, so the affected ear is facing downwards.
2. **Gently Pull Your Ear Lobe:** While your head is tilted, gently pull your ear lobe downwards and slightly backwards. This helps to straighten the ear canal, allowing the water to flow out more easily.
3. **Jiggle or Hop:** You can try gently jiggling your head or even hopping on the leg of the same side. This slight movement can create vibrations that help to dislodge the water.
4. **Be Patient:** Give it a minute or two. Sometimes, it just needs a little time to drain.

This method is especially effective for smaller amounts of water. Think of it as giving your ear a gentle nudge to release its watery prisoner.

The Blow Dryer Trick (Low and Cool!)

This method uses gentle warmth and airflow to evaporate the trapped water. It's surprisingly effective, but it's crucial to do it correctly to avoid damaging your delicate ear structures.

1. **Set Your Blow Dryer:** Use the lowest heat setting and the lowest speed setting on your blow dryer.

2. **Hold It at a Distance:** Keep the blow dryer at least 12 inches (about 30 cm) away from your ear.
3. **Direct the Airflow:** Gently direct the cool, low-speed airflow towards your ear canal.
4. **Move It Around:** Don't hold the dryer in one spot. Move it back and forth gently.
5. **Listen and Feel:** You should feel a gentle breeze, not heat or strong force. Continue for a minute or two, then switch ears (even if the other one feels fine, it's good practice).

Important Note: Never use hot air, and never blast air directly into your ear. The goal is gentle evaporation, not a high-powered ear cleaning.

The Ear Drop Solution (Your DIY Swimmer's Ear Prevention)

This is a highly recommended method, especially if you're prone to swimmer's ear or if the water seems particularly stubborn. The principle behind this is creating a solution that helps to evaporate the water and dry out the ear canal.

The Rubbing Alcohol and White Vinegar Mix

This is the most common and effective DIY ear drop solution. It works because both rubbing alcohol and vinegar have drying properties, and the acidity of vinegar can help to prevent bacterial growth.

What You'll Need:

1. Rubbing alcohol (isopropyl alcohol)
2. White vinegar
3. A clean dropper
4. A small bowl or cup

How to Make and Use It:

1. **Mix Equal Parts:** In your small bowl, mix equal parts of rubbing alcohol and white vinegar. For example, if you use 1 tablespoon of rubbing alcohol, add 1 tablespoon of white vinegar.
2. **Tilt Your Head:** Tilt your head to the side, so the affected ear is facing upwards.
3. **Apply the Drops:** Using the clean dropper, gently place 3-4 drops of the solution into your ear canal.
4. **Stay Still:** Keep your head tilted for about 30 seconds to a minute, allowing the solution to work its way into the ear canal. You might feel a slight tingling or warmth, which is normal.
5. **Tilt the Other Way:** Now, tilt your head in the opposite direction, so the affected ear is facing downwards, over a sink or towel.
6. **Let It Drain:** Allow the solution and any trapped water to drain out. You might hear some gurgling sounds.
7. **Dry Gently:** Gently dry the outside of your ear with a clean towel.

You can repeat this a couple of times a day if needed. This is also an excellent preventative measure if you're going to be in the water frequently.

Over-the-Counter Ear Drops

If you prefer not to make your own, there are several commercially available ear drops designed to dry out the ear. These often contain carbamide peroxide, which helps to loosen earwax, and other drying agents. Follow the instructions on the packaging carefully.

The Chewing Gum Trick (A Surprisingly Effective Method)

This might sound a bit quirky, but the act of chewing can help to open up the Eustachian tube, which connects the middle ear to the back of the throat. This can sometimes create enough pressure change to help dislodge water.

1. **Find Some Gum:** Grab a piece of chewing gum.
2. **Chew Vigorously:** Chew the gum with enthusiasm.
3. **Yawn:** While chewing, try to yawn widely. The combination of chewing and yawning can help to equalize pressure and potentially release trapped water.

While not as scientifically proven as other methods, many people find relief with this simple technique. It's worth a shot if

you're looking for a quick fix.

The Valsalva Maneuver (With Caution!)

This technique involves creating pressure in your middle ear to open the Eustachian tubes. It's often used by divers and pilots to equalize pressure, but it can also help with trapped water.

1. **Pinch Your Nose:** Close your nostrils by pinching your nose shut with your fingers.
2. **Close Your Mouth:** Keep your mouth closed.
3. **Gently Blow:** Gently try to exhale through your nose. Imagine you are trying to blow up a balloon with your nose. You should feel a slight "pop" in your ears.

Important Caution: Do NOT blow hard. A forceful Valsalva maneuver can damage your eardrum. If you don't feel a gentle pop or if you experience any pain, stop immediately. This method is best used with caution and ideally after consulting a healthcare professional if you're unsure.

Things to Absolutely AVOID When Trying to Get Water Out of Your Ear

This is just as important as knowing what to do. Certain actions can actually make the problem worse or cause serious damage.

1. **Cotton Swabs (Q-tips):** These are the mortal enemies of

healthy ears. They don't remove earwax or water; they just push it further down the ear canal, compacting it and making it harder to get out. They can also scratch the delicate lining of your ear, leading to infection.

2. **Ear Candling:** This is a dangerous and ineffective practice. There's no scientific evidence that it works, and it carries risks of burns, ear canal blockage from wax residue, and even eardrum perforation.
3. **Sharp Objects:** Never insert anything sharp or pointed into your ear canal. This includes bobby pins, paper clips, or keys. You risk puncturing your eardrum or causing severe injury.
4. **Excessive Force:** Whether it's blowing your nose too hard or trying to force water out with aggressive movements, avoid any action that causes pain or discomfort.

When to Seek Professional Help

While most cases of trapped water resolve themselves with simple remedies, there are times when you should consult a doctor or an audiologist.

1. **Persistent Water:** If you've tried several methods and the water still feels trapped after 24-48 hours, it's time to get it checked.
2. **Pain or Discomfort:** Significant ear pain, especially if accompanied by fever, could indicate an ear infection.

3. **Discharge:** If you notice any pus or foul-smelling discharge from your ear.
4. **Hearing Loss:** If you experience significant muffling or hearing loss that doesn't improve after a day or two.
5. **Dizziness or Vertigo:** These symptoms, along with trapped water, could indicate a more serious inner ear issue.
6. **Recent Surgery or Ear Conditions:** If you have a history of ear surgery, eardrum perforation, or other chronic ear conditions, it's best to err on the side of caution and seek medical advice.

Preventing Water From Getting Stuck in Your Ear

Prevention is always better than cure, right? Here are a few tips to minimize your chances of experiencing that annoying earwater:

1. **Earplugs:** Invest in a good pair of swim earplugs, especially if you swim frequently or are prone to swimmer's ear.
2. **Drying Your Ears After Water Exposure:** After swimming, showering, or any water activity, gently dry the outer ear with a towel. You can also use the gentle blow dryer method (low, cool setting, 12 inches away) for a minute or two.
3. **Manage Earwax:** If you have a tendency to build up a lot of earwax, talk to your doctor about safe earwax removal methods.

4. **Use a Hair Dryer (Again!):** After showering, a quick blast of cool air from a hair dryer can help dry out the ear canal.

Conclusion: Say Goodbye to That Watery Intruder!

Getting water out of your ear is usually a straightforward and manageable issue. By understanding the safe and effective methods, you can quickly regain comfort and prevent potential complications. Remember to always prioritize gentle techniques and avoid anything that could harm your ear. So, the next time you feel that familiar waterlogged sensation, you'll be well-equipped to banish it and get back to enjoying your day, free from that pesky earwater.

Getting water out of the ear is a common yet often uncomfortable experience, especially after swimming or showering. While it may seem trivial, understanding how water becomes trapped and effective methods to remove it can prevent irritation, infection, and temporary hearing discomfort. This article explores the science behind water in the ear, practical techniques for removal, preventive strategies, and long-term care, offering both immediate relief and lasting protection.

The Science Behind Water Trapped in the Ear Understanding why water remains lodged in the ear begins with anatomy. The external ear canal is a narrow, L-shaped passage designed to protect the eardrum while facilitating sound conduction. When water enters—whether from swimming, bathing, or even rain—it often settles deep in the canal due to its natural curvature and the protective wax lining. The canal’s small diameter and slight upward angle hinder easy drainage, especially when residual moisture combines with earwax or debris. This trapped moisture creates a moist environment ideal for bacteria and

fungi, potentially leading to swimmer's ear or an uncomfortable fullness. Recognizing how water becomes trapped helps in choosing the most effective removal method.

Effective Techniques for Removing Water from the Ear When water settles in the ear, immediate action is key to restoring comfort and preventing complications. A gentle tilting practice is among the simplest and safest approaches: standing under a warm shower or using a tilted head position allows gravity to assist drainage. After tilting the affected ear toward the ground, lightly tapping on the outer ear—similar to cupping hands

gently—can dislodge the water. For more persistent cases, a few drops of rubbing alcohol mixed with white vinegar help evaporate moisture and reduce microbial risk. Alternatively, a hair dryer set to the lowest, warmest setting, held at arm's length and just behind the ear, provides controlled airflow to evaporate trapped water without causing harm. These methods are non-invasive and effective when applied with care.

Practical Applications and When to Seek Medical Help Besides immediate relief, knowing how to remove water from the ear supports broader health maintenance. Athletes, divers, and

frequent swimmers especially benefit from proactive strategies, including drying ears thoroughly after exposure and using earplugs designed to prevent water entry. If water remains stubbornly trapped or symptoms like pain, swelling, or hearing loss develop, it may signal an infection or perforated eardrum—conditions requiring professional evaluation. Persistent moisture can also contribute to chronic ear issues, making early and proper removal essential to avoid complications like otitis externa. Recognizing when to consult a healthcare provider ensures timely intervention and long-term ear health.

Long-Term Prevention and Ear Care Practices Preventing water from lingering in the ear involves simple yet consistent habits. After swimming or showering, gently tipping the head side to side helps drain moisture, while a soft towel wrap around the ear minimizes water absorption. Using silicone or custom-fitted earplugs designed for water activities offers strong protection without compromising comfort. In addition, avoiding cotton swabs—known to push wax deeper—preserves the ear’s natural defenses. For those prone to recurrent issues, regular consultation with an audiologist or ENT specialist can

provide personalized strategies, including wax management or canal reconstruction if structural factors contribute to moisture retention. These preventive measures not only reduce discomfort but also support overall ear wellness.

Looking Ahead: Innovation in Ear Health and Moisture Management The future of ear care is evolving with advancements in materials science and digital health. Researchers are developing smart earplugs embedded with sensors to monitor moisture levels and alert users when water is present, enabling proactive drying. Meanwhile, biomedical engineers are exploring biocompatible

coatings that repel water while maintaining the ear's natural protective flora. As awareness of ear health grows, so does the emphasis on personalized, preventive care—ensuring that simple discomforts like water in the ear become manageable with accessible, science-backed solutions. Staying informed and adopting emerging tools empowers individuals to maintain clean, dry ears safely and effectively.

Trapped! How to Get Water Out of Your Ear Safely and Effectively

The unwelcome sensation of water trapped in your ear can range from a mild annoyance to a disruptive

discomfort, sometimes even leading to hearing loss or infection if left untreated. Whether it's from a dip in the pool, a vigorous shower, or a day at the beach, understanding how to safely and effectively get water out of your ear is a crucial piece of everyday health knowledge. This comprehensive guide will equip you with a range of proven methods, from simple home remedies to when you should seek professional medical advice.

We'll delve into the anatomy of the ear to understand why water gets trapped, explore the best DIY techniques, discuss what **not to do to avoid further complications, and identify the warning signs that indicate a more serious issue**

requiring a doctor's attention. Mastering these techniques can bring quick relief and prevent potential ear problems, ensuring your auditory well-being.

Understanding Why Water Gets Stuck in Your Ear

Before we tackle the solutions, it's helpful to understand the mechanics of why water can become lodged in your ear canal. The ear canal, also known as the external auditory canal, is a narrow, tube-like structure that leads from the outer ear to the eardrum. Its shape and lining can make it prone to trapping moisture. Several factors contribute to this:

The Shape and Structure of the Ear Canal

The human ear canal isn't perfectly straight. It has a gentle curve, which can create small pockets where water can accumulate. For some individuals, the ear canal might be narrower or have a more pronounced curve, increasing the likelihood of water retention.

Earwax (Cerumen) Buildup

Earwax is a natural secretion that lubricates and protects the ear canal. However, excessive earwax buildup can act like a dam, preventing water from draining out easily. This is a common reason for that persistent plugged-up feeling after swimming.

Swollen Ear Canals

Conditions like swimmer's ear (otitis externa), a bacterial or fungal infection of the ear canal, can cause swelling. This inflammation further narrows the ear canal, making it even harder for water to escape and often exacerbating the discomfort.

Changes in Water Pressure

During activities like diving or even vigorous swimming, changes in water pressure can affect how easily water enters and exits the ear canal.

Effective Home Remedies: Getting Water Out of Your Ear

Fortunately, most cases of trapped water can be resolved with simple, safe,

and readily available home remedies. The key is to use gravity and gentle methods to encourage drainage without causing damage.

The Gravity Trick: Tilting Your Head

This is the most straightforward and often the most effective method. Gravity is your best friend when it comes to draining water from the ear.

- 1. How to do it: Stand or sit and tilt your head towards the affected ear, bringing it as close to your shoulder as possible. Hold this position for about 30 seconds. You can gently tug on your earlobe in different directions while tilted to help open up the ear canal and encourage drainage.**

- 2. Why it works: By changing the angle of your head, you create a downward slope that allows water to flow out of the ear canal.**
- 3. Tips: You can place a towel or tissue at the ear to catch any draining water. Repeat this process a few times if necessary.**

The Hair Dryer Method: Gentle Warmth

A low heat setting on your hair dryer can create airflow that helps evaporate residual moisture in the ear canal.

- 1. How to do it: Set your hair dryer to its lowest heat and fan setting. Hold it at least 12 inches (30 cm) away from your ear. Gently direct the airflow towards your ear canal for a minute or**

- two. Move the dryer constantly to avoid overheating any single spot.**
- 2. Why it works: The warm, dry air helps to evaporate the water in the ear canal, similar to how it dries your hair.**
- 3. Caution: Never use hot air, as this can damage the delicate structures of your ear. Ensure the dryer is on the lowest setting and held at a safe distance.**

The Ear Pull and Tilt Combination

This method combines the gravity trick with a slight manipulation of the ear.

- 1. How to do it: Tilt your head towards the affected side. While tilted, gently pull your earlobe downwards and slightly outwards. This action can help**

straighten the ear canal, allowing trapped water to escape more easily.

- 2. Why it works: Pulling on the earlobe can change the shape of the ear canal, creating a more direct path for water to drain.**
- 3. Repetition: Try this for about 30 seconds, then straighten up and repeat if needed.**

The Valsalva Maneuver (Use with Caution)

This technique is more commonly used to equalize pressure in the middle ear, but it can sometimes help dislodge water from the Eustachian tube, which can indirectly assist in clearing the ear canal.

- 1. How to do it: Close your mouth and**

pinch your nostrils shut. Gently try to exhale through your nose as if you were blowing your nose, but keep your mouth closed. You might feel a slight "pop" or "click" in your ear.

- 2. Why it works: This maneuver opens up the Eustachian tube, which connects the middle ear to the back of the throat. This can sometimes help create a pathway for water to drain.**
- 3. Strict Caution: This method should be used with extreme caution, especially if you have any ear pain or suspect an infection. Forceful blowing can damage your eardrum. If you're unsure, avoid this method.**

Over-the-Counter Ear Drops

Several over-the-counter (OTC) ear

drops are specifically designed to help dry out the ear canal and prevent swimmer's ear. These drops typically contain a drying agent like isopropyl alcohol or acetic acid (vinegar).

- 1. Isopropyl Alcohol Drops: These drops work by absorbing moisture in the ear canal, helping it to evaporate. They are very effective for drying out the ear after swimming.**
- 2. Vinegar Drops: A mixture of equal parts white vinegar and rubbing alcohol can also be used. The vinegar helps to create an acidic environment that discourages bacterial growth, and the alcohol helps to dry the ear.**
- 3. How to use: Follow the instructions on the product packaging carefully.**

Typically, you'll tilt your head, apply a few drops, and then keep your head tilted for a few minutes before allowing the liquid to drain out.

- 4. When to consider: If you frequently get water trapped in your ears or are prone to swimmer's ear, these drops can be a good preventative measure.**

What NOT to Do When Water is Stuck in Your Ear

While the urge to quickly dislodge water can be strong, certain actions can cause more harm than good. Avoiding these common mistakes is crucial for ear health.

Do Not Use Cotton Swabs (Q-tips)

This is perhaps the most critical rule.

Cotton swabs are often the culprit behind more serious ear issues. Instead of removing water, they tend to:

- 1. Push water and earwax further in: This can create a blockage that is even harder to remove and can trap moisture.**
- 2. Irritate or damage the ear canal: The delicate skin of the ear canal can be easily scratched or abraded, leading to pain and infection.**
- 3. Puncture the eardrum: In severe cases, inserting a cotton swab too deeply can perforate the eardrum, a serious injury requiring medical attention.**

Do Not Use Sharp Objects

Never insert anything other than what is medically prescribed (like specific ear drops) into your ear canal. This includes keys, bobby pins, fingernails, or any other pointy object. The risk of severe injury, infection, and permanent hearing damage is extremely high.

Do Not Use High-Pressure Water or Air

While gentle airflow from a hair dryer can help, using high-pressure water jets (like from a water pick) or a powerful air compressor to try and blow water out can be dangerous. These methods can damage the eardrum or push water and debris deeper into the ear.

Do Not Ignore Persistent Discomfort or Pain

If you've tried gentle home remedies and the water still feels trapped, or if you experience increasing pain, discharge, or a feeling of fullness, do not continue to self-treat. This could indicate a developing infection or another underlying issue.

When to Seek Professional Medical Help

While most cases of water in the ear resolve on their own or with simple home remedies, there are times when professional medical intervention is necessary. Recognizing these signs will help you protect your hearing and overall ear health.

Signs of Swimmer's Ear (Otitis Externa)

Swimmer's ear is an infection of the outer ear canal, often caused by water that remains in the ear after swimming, creating a moist environment for bacteria or fungi to grow. Symptoms include:

- 1. Intense ear pain, especially when touching the outer ear or chewing**
- 2. Redness and swelling of the ear canal**
- 3. Itching within the ear canal**
- 4. Drainage from the ear (clear, white, yellow, or even greenish)**
- 5. A feeling of fullness or blockage in the ear**
- 6. Temporary hearing loss**

If you suspect you have swimmer's ear,

consult a doctor. They can prescribe antibiotic or antifungal ear drops to clear the infection.

Persistent Blockage or Hearing Loss

If the feeling of water in your ear persists for more than a day or two despite trying home remedies, or if you experience significant hearing loss, it's time to see a doctor. This could be due to a severe earwax impaction or another blockage that requires professional removal.

Severe Pain or Discharge

Any sharp, severe ear pain, or the presence of pus-like discharge, is a strong indicator of a potential infection or injury. Seek immediate medical

attention.

Tinnitus or Vertigo

If you experience ringing in your ears (tinnitus) or dizziness (vertigo) along with water in your ear, it could signal a more serious issue affecting the middle or inner ear. Consult a healthcare professional.

After Injury

If water becomes trapped in your ear following an injury to the ear, such as a blow to the head or a fall, it's essential to have it checked by a doctor to rule out any damage to the eardrum or inner ear structures.

Preventing Water From Getting Trapped in Your Ears

The best approach to dealing with water in your ear is to prevent it from becoming a problem in the first place. Here are some proactive measures:

Use Earplugs

For swimmers, divers, or even during showering, wearing custom-fitted earplugs or disposable swim earplugs can create a watertight seal, preventing water from entering the ear canal.

Dry Your Ears Thoroughly After Exposure to Water

After swimming or showering, gently dry the outer part of your ear with a soft towel. You can also use a hair dryer on

a low, cool setting from a distance to ensure the canal is completely dry.

Consider Over-the-Counter Drying Drops

As mentioned earlier, using OTC ear drops designed to dry the ear canal after water exposure can be a very effective preventative measure, especially for those prone to swimmer's ear.

Manage Earwax Buildup

If you have a history of earwax issues, talk to your doctor about safe ways to manage earwax. Regular, gentle cleaning as advised by your doctor can prevent blockages that trap water.

Conclusion

Dealing with water trapped in your ear is a common, often minor, inconvenience. By understanding the simple yet effective home remedies, knowing what to avoid, and recognizing when to seek professional help, you can confidently manage this situation.

Prioritizing safe techniques and listening to your body will ensure your ear canal remains healthy, clear, and free from discomfort, allowing you to enjoy all your aquatic adventures without worry.

Questions & Answers About how to get water out of your ear

No	Question	Answer
-----------	-----------------	---------------

1	My ear feels clogged with water after swimming, what's the quickest way to drain it?	Try tilting your head to the side, with the affected ear facing down, and gently pull your earlobe in different directions to open the ear canal. Gravity can do a lot of the work!
2	I have water stuck in my ear and it's really uncomfortable. Are there any safe home remedies?	Yes! A common and effective method is to lie on your side with the waterlogged ear facing up for a few minutes. You can also try the 'hair dryer trick' on a low, cool setting, holding it a few inches away from your ear.
3	Can I use ear drops to get water out of my ear?	Absolutely. Over-the-counter ear drying drops, often containing alcohol and acetic acid, can help evaporate the water and prevent swimmer's ear. Follow the product instructions carefully.
4	What's the 'Valsalva maneuver' and can it help with water in my ear?	The Valsalva maneuver (gently blowing out with your mouth and nose closed) can help equalize pressure in your middle ear, which might dislodge water if it's trapped behind the eardrum, but it's not primarily for draining surface water from the ear canal.
5	I tried everything, but the water is still in my ear. When should I see a doctor?	If you experience persistent pain, drainage, hearing loss, dizziness, or if the water doesn't drain after 2-3 days of home remedies, it's time to consult a doctor to rule out infection or other issues.

6	Is it safe to use a cotton swab to get water out of my ear?	No, it's generally not recommended. Cotton swabs can push water further into the ear canal or even damage the eardrum. Stick to gentler methods like gravity or drying drops.
7	My child has water in their ear after a bath, what's the best way to help them?	For children, the gravity method (tilting the head) and gentle drying with a towel around the outer ear are safest. You can also use specialized pediatric ear drops designed for drying water, but always consult a pediatrician first if you have concerns.
8	I'm worried about getting swimmer's ear. How can I prevent water from getting trapped?	Wear earplugs designed for swimming, use a swim cap that covers your ears, and tilt your head after swimming to let any water drain out. Consider using an alcohol-based ear drying solution after swimming.
9	What happens if water stays in my ear for too long?	Prolonged water in the ear canal can create a warm, moist environment perfect for bacterial or fungal growth, leading to infections like swimmer's ear (otitis externa), which can be painful and cause other symptoms.
10	Can I use rubbing alcohol to dry out my ear if I have water in it?	Yes, a mixture of rubbing alcohol and white vinegar (equal parts) can be effective. The alcohol helps evaporate the water, and the vinegar helps prevent bacterial growth. Use only a few drops and tilt your head to let it drain. *Avoid if you have a perforated eardrum or ear tubes.*
