Every mathematical discipline, no matter how advanced, rests on the bedrock of arithmetic. These are the operations you likely learned in elementary school, but they are essential for everyday life and more complex calculations.

Addition Problems with Answers

Addition is about combining quantities. **Problem 1:** Sarah has 5 apples and John gives her 3 more apples. How many apples does Sarah have in total? **Solution:** To find the total number of apples, we add the number of apples Sarah had initially to the number John gave her. $5 \text{ apples} + 3 \text{ apples} = 8 \text{ apples}$. **Answer:** Sarah has 8 apples. **Problem 2:** A bakery sold 125 croissants on Monday and 180 croissants on Tuesday. How many croissants did they sell over the two days? **Solution:** We add the number of croissants sold on Monday and Tuesday. $125 + 180 = 305$ **Answer:** The bakery sold 305 croissants.

Subtraction Problems with Answers

Subtraction is about finding the difference between two quantities or taking away from a set. **Problem 3:** Tom had 10 cookies and ate 4 of them. How many cookies does Tom have left? **Solution:** We subtract the number of cookies Tom ate from the number he had initially. $10 \text{ cookies} - 4 \text{ cookies} = 6 \text{ cookies}$. **Answer:** Tom has 6 cookies left. **Problem 4:** A library had 520 books. If 75 books were checked out, how many books remain in the library? **Solution:** We subtract the number of checked-out books from the total number of books. $520 - 75 = 445$ **Answer:** 445 books remain in the library.

Multiplication Problems with Answers

Multiplication is a shortcut for repeated addition. **Problem 5:** A farmer plants 6 rows of corn, with 8 corn plants in each row. How many corn plants did the farmer plant in total? **Solution:** To find the total number of plants, we multiply the number of rows by the number of plants per row. $6 \text{ rows} * 8 \text{ plants/row} = 48 \text{ plants}$. **Answer:** The farmer planted 48 corn plants. **Problem 6:** If a car travels at an average speed of 60 miles per hour, how far will it travel in 4 hours? **Solution:** Distance = Speed * Time $60 \text{ miles/hour} * 4 \text{ hours} = 240 \text{ miles}$. **Answer:** The car will travel 240 miles.

Division Problems with Answers

Division is about splitting a quantity into equal parts or finding how many times one number fits into another. **Problem 7:** You have 24 candies to share equally among 4 friends. How many candies does each friend receive? **Solution:** We divide the total number of candies by the number of friends. $24 \text{ candies} / 4 \text{ friends} = 6 \text{ candies/friend}$. **Answer:**

Each friend receives 6 candies. ****Problem 8:**** A baker needs to make 150 cupcakes. If each batch makes 12 cupcakes, how many batches does the baker need to make? ****Solution:**** We divide the total number of cupcakes by the number of cupcakes per batch. $150 \text{ cupcakes} / 12 \text{ cupcakes/batch} = 12.5 \text{ batches}$. Since you can't make half a batch and need to ensure all cupcakes are made, the baker would need to make 13 batches. However, for a straightforward division problem where a fractional answer is acceptable, the mathematical result is 12.5. ****Answer:**** The baker needs to make 12.5 batches. (For practical purposes, 13 batches).

Fractions and Decimals: Parts of a Whole

Fractions and decimals are ways to represent numbers that are not whole. They are fundamental for understanding proportions, percentages, and many scientific and financial calculations.

Fraction Addition and Subtraction

****Problem 9:**** Mary ate $\frac{1}{4}$ of a pizza, and her brother ate $\frac{1}{3}$ of the same pizza. What fraction of the pizza did they eat together? ****Solution:**** To add fractions, they must have a common denominator. The least common multiple of 4 and 3 is 12. $\frac{1}{4} = \frac{3}{12}$ $\frac{1}{3} = \frac{4}{12}$ Now, add the fractions: $\frac{3}{12} + \frac{4}{12} = \frac{7}{12}$ ****Answer:**** They ate $\frac{7}{12}$ of the pizza together.

****Problem 10:**** A recipe calls for $\frac{3}{4}$ cup of flour. If you only have $\frac{1}{2}$ cup, how much more flour do you need? ****Solution:**** We need to subtract the amount of flour you have from the amount required. First, find a common denominator for 4 and 2, which is 4. $\frac{3}{4} \text{ cup} - \frac{1}{2} \text{ cup} = \frac{2}{4}$ $\frac{3}{4} - \frac{2}{4} = \frac{1}{4}$ ****Answer:**** You need $\frac{1}{4}$ cup more flour.

Decimal Operations

****Problem 11:**** John bought a book for \$15.75 and a pen for \$3.50. How much did he spend in total? ****Solution:**** Add the prices, aligning the decimal points. $\$15.75 + \$3.50 = \$19.25$ ****Answer:**** John spent \$19.25. ****Problem 12:**** A jug contains 2.5 liters of water. If you pour out 0.75 liters, how much water is left? ****Solution:**** Subtract the amount poured out, aligning the decimal points. $2.50 \text{ liters} - 0.75 \text{ liters} = 1.75 \text{ liters}$ ****Answer:**** 1.75 liters of water are left.

Algebra: The Language of Unknowns

Algebra introduces variables (like 'x' or 'y') to represent unknown quantities. This allows us to solve for these unknowns and express relationships between numbers more abstractly.

Solving Linear Equations

Linear equations are equations where the highest power of the variable is 1. The goal is to isolate the variable. ****Problem 13:**** Solve for x: $2x + 5 = 15$ ****Solution:**** 1. Subtract 5 from both sides of the equation to isolate the term with x: $2x + 5 - 5 = 15 - 5$ $2x = 10$ 2. Divide both sides by 2 to solve for x: $2x / 2 = 10 / 2$ $x = 5$ ****Answer:**** $x = 5$. ****Problem 14:**** Solve for y: $3y - 7 = 2y + 1$ ****Solution:**** 1. Get all the 'y' terms on one side and the constant terms on the other. Subtract 2y from both sides: $3y - 2y - 7 = 2y - 2y + 1$ $y - 7 = 1$ 2. Add 7 to both sides to isolate y: $y - 7 + 7 = 1 + 7$ $y = 8$ ****Answer:**** $y = 8$.

Word Problems in Algebra

Algebraic skills are particularly powerful when applied to word problems. ****Problem 15:**** The sum of two consecutive integers is 45. Find the two integers. ****Solution:**** Let the first integer be 'n'. Since the integers are consecutive, the next integer will be 'n + 1'. The sum of these two integers is 45. So, we can write the equation: $n + (n + 1) = 45$ 1. Combine like terms: $2n + 1 = 45$ 2. Subtract 1 from both sides: $2n = 44$ 3. Divide by 2: $n = 22$ The first integer is 22. The second consecutive integer is $n + 1 = 22 + 1 = 23$. ****Answer:**** The two consecutive integers are 22 and 23.

Geometry: The Study of Shapes and Space

Geometry deals with shapes, sizes, positions of figures, and properties of space.

Area Calculations

****Problem 16:**** Calculate the area of a rectangle with a length of 10 cm and a width of 5 cm. ****Solution:**** The formula for the area of a rectangle is $\text{Area} = \text{Length} \times \text{Width}$. $\text{Area} = 10 \text{ cm} \times 5 \text{ cm}$ $\text{Area} = 50 \text{ cm}^2$ ****Answer:**** The area of the rectangle is 50 square centimeters. ****Problem 17:**** Find the area of a circle with a radius of 7 meters. Use $\pi \approx 22/7$. ****Solution:**** The formula for the area of a circle is $\text{Area} = \pi r^2$, where 'r' is the radius. $\text{Area} = (22/7) \times (7 \text{ m})^2$ $\text{Area} = (22/7) \times (49 \text{ m}^2)$ $\text{Area} = 22 \times 7 \text{ m}^2$ $\text{Area} = 154 \text{ m}^2$ ****Answer:**** The area of the circle is 154 square meters.

Perimeter Calculations

****Problem 18:**** What is the perimeter of a square with sides of length 6 inches? ****Solution:**** The perimeter of a square is the sum of all its sides, or $4 \times \text{side length}$. $\text{Perimeter} = 4 \times 6 \text{ inches}$ $\text{Perimeter} = 24 \text{ inches}$ ****Answer:**** The perimeter of the square is 24 inches.

Trigonometry: Angles and Sides

Trigonometry is a branch of mathematics that studies relationships between side lengths and angles of triangles.

****Problem 19:**** In a right-angled triangle, the side opposite the angle θ is 5 units long, and the adjacent side is 12 units long. Calculate the tangent of angle θ ($\tan \theta$). ****Solution:**** The tangent of an angle in a right-angled triangle is defined as the ratio of the length of the opposite side to the length of the adjacent side. $\tan \theta = \text{Opposite} / \text{Adjacent}$ $\tan \theta = 5 / 12$ ****Answer:**** $\tan \theta = 5/12$. ****Problem 20:**** If the sine of an angle α is 0.5, what is the measure of angle α ? ****Solution:**** We need to find the angle whose sine is 0.5. This is a standard value. $\sin \alpha = 0.5$ $\alpha = \arcsin(0.5)$ $\alpha = 30^\circ$ ****Answer:**** The measure of angle α is 30 degrees.

Calculus: The Study of Change

Calculus, developed by Newton and Leibniz, deals with rates of change and accumulation. It's a powerful tool in physics, engineering, economics, and more.

Basic Differentiation

Differentiation helps us find the instantaneous rate of change of a function. ****Problem 21:**** Find the derivative of the function $f(x) = 3x^2 + 5x - 2$ with respect to x . ****Solution:**** We use the power rule for differentiation: $d/dx (x^n) = nx^{n-1}$. $d/dx (3x^2) = 3 \times 2x^{2-1} = 6x^1 = 6x$ $d/dx (5x) = 5 \times 1x^{1-1} = 5x^0 = 5 \times 1 = 5$ $d/dx (-2) = 0$ (the derivative of a constant is always zero) So, $f'(x) = 6x + 5$. ****Answer:**** The derivative of $f(x)$ is $f'(x) = 6x + 5$.

Basic Integration

Integration is the reverse process of differentiation; it's used to find areas under curves and cumulative quantities.

****Problem 22:**** Find the indefinite integral of the function $f(x) = 2x + 3$ with respect to x . ****Solution:**** We use the power rule for integration: $\int x^n dx = (x^{n+1})/(n+1) + C$. $\int (2x + 3) dx = \int 2x dx + \int 3 dx = 2 \times (x^{1+1})/(1+1) + 3 \times (x^{0+1})/(0+1) + C = 2 \times (x^2)/2 + 3 \times (x^1)/1 + C = x^2 + 3x + C$ ****Answer:**** The indefinite integral is $x^2 + 3x + C$, where C is the constant of integration.

Putting It All Together: Complex Problems

As you progress, you'll encounter problems that combine multiple concepts. **Problem 23:** A rectangular garden has a perimeter of 40 meters. If the length is 4 meters more than the width, find the dimensions of the garden. **Solution:** Let the width of the garden be ' w ' meters. Then the length is ' $w + 4$ ' meters. The formula for the perimeter of a rectangle is $P = 2(l + w)$. We are given $P = 40$ meters. So, $40 = 2((w + 4) + w)$ 1. Simplify inside the parentheses: $40 = 2(2w + 4)$ 2. Distribute the 2: $40 = 4w + 8$ 3. Subtract 8 from both sides: $32 = 4w$ 4. Divide by 4: $w = 8$ So, the width is 8 meters. The length is $w + 4 = 8 + 4 = 12$ meters. **Answer:** The dimensions of the garden are 8 meters by 12 meters. **Problem 24:** A car starts from rest and accelerates uniformly at a rate of 2 m/s^2 . How far will it travel in 10 seconds? **Solution:** This is a physics problem that uses kinematic equations, which are derived from calculus. We can use the equation: $s = ut + (1/2)at^2$ where: s = displacement (distance) u = initial velocity t = time a = acceleration Given: $u = 0 \text{ m/s}$ (starts from rest) $a = 2 \text{ m/s}^2$ $t = 10 \text{ s}$ Substitute the values into the formula: $s = (0 \text{ m/s})(10 \text{ s}) + (1/2)(2 \text{ m/s}^2)(10 \text{ s})^2$ $s = 0 + (1 \text{ m/s}^2)(100 \text{ s}^2)$ $s = 100 \text{ meters}$ **Answer:** The car will travel 100 meters.

Exploring Math Problems with Answers: A Gateway to Deeper Understanding

Mathematics is not merely a collection of numbers and formulas; it is a language of logic, a framework for problem-solving, and a tool for interpreting the world around us. When students engage with well-structured math problems accompanied by clear answers, they gain more than just correct solutions—they build a foundation of confidence, analytical thinking, and real-world application. Understanding how math problems are framed, solved, and verified is essential for progressing from basic computation to higher-order reasoning.

The Nature of Effective Math Problems

A well-designed math problem transcends simple memorization. It presents a meaningful context that challenges learners to apply concepts in novel ways. For instance, consider the problem: “A bakery sells loaves of bread in packages of 6 and 9. What is the smallest number of loaves that can be purchased using at least one package of each size?” At first glance, it may appear as a straightforward equation, but its true value lies in prompting students to explore multiples, least common multiples, and logical reasoning. The correct answer—18—emerges naturally when students analyze combinations and recognize patterns in number sequences, reinforcing both arithmetic fluency and strategic thinking.

Real-World Applications of Math Problems

Math problems with clear answers serve as bridges between abstract theory and tangible reality. In everyday life, from managing budgets and measuring ingredients in cooking to planning travel routes and analyzing data, mathematical reasoning is indispensable. Take, for example, a problem involving rates: “If a car travels 60 miles in 1.5 hours, what is its average speed?” Solving this not only involves dividing distance by time but also reinforces understanding of units, proportionality, and real-time decision-making. Such problems ground theoretical knowledge in practical relevance, making math accessible and meaningful.

Benefits of Studying Problems with Solutions

Engaging with math problems and reviewing their answers cultivates a growth mindset. When learners encounter a challenging question and eventually arrive at the correct solution—whether through trial and error, systematic methods, or conceptual insight—they develop resilience and a deeper appreciation for the discipline. This process nurtures metacognitive skills: students learn not just what to do, but how to think through problems methodically. Moreover, understanding the reasoning behind answers prevents rote learning, encouraging students to internalize principles that apply across diverse scenarios. Over time, this approach transforms math from a subject of anxiety into one of empowerment.

Looking Ahead: The Future of Math Problem-Solving

As education evolves, so does the way math problems are presented and solved. Digital platforms now offer interactive problem sets that provide instant feedback, adaptive challenges that adjust to individual skill levels, and visualizations that clarify complex concepts. Emerging technologies like artificial intelligence enable personalized learning paths, where students receive targeted problems based on their progress and misconceptions. Yet, the core remains unchanged: the power of well-structured math problems with accurate answers lies in their ability to stimulate curiosity, reinforce understanding, and build lifelong analytical skills. In the future, math education will continue to emphasize critical thinking, real-world relevance, and inclusive learning—ensuring that every student can not only solve problems but also create solutions.

Unlocking Understanding: A Deep Dive into Example Math Problems with Answers

The journey of mastering mathematics is often paved with practice. For students, educators, and lifelong learners alike, engaging with well-crafted **example math problems with answers** serves as a crucial stepping stone. These problems are not merely exercises; they are diagnostic tools, pedagogical aids, and confidence builders. This article aims to provide a comprehensive, analytical exploration of why these examples are so vital, categorizing them by difficulty and

subject, and offering insights into how to best leverage them for optimal learning outcomes. We'll also touch upon where to find reliable resources for these invaluable learning materials.

The Indispensable Role of Example Math Problems

Before delving into specific examples, it's essential to understand the pedagogical significance of worked-out math problems. They bridge the gap between theoretical concepts and practical application. When a student encounters a new mathematical idea, it can feel abstract. Seeing it applied in a concrete problem with a clear, step-by-step solution demystifies the process. This is particularly true for areas like **algebra word problems with solutions** or **calculus problems with detailed solutions**, where translating concepts into equations and manipulating them requires a nuanced understanding.

Key benefits include:

1. **Clarifying Concepts:** Visualizing how a formula or theorem is used in practice reinforces understanding.
2. **Developing Problem-Solving Strategies:** Observing different approaches to solve similar problems exposes learners to a variety of techniques, fostering adaptability.
3. **Identifying Weaknesses:** Incorrectly solving a problem, or struggling to understand the provided solution, highlights areas needing more attention.
4. **Building Confidence:** Successfully working through problems and verifying answers with a correct solution instills a sense of accomplishment and encourages further engagement.
5. **Preparing for Assessments:** Familiarity with common problem types and their solutions is a cornerstone of effective test preparation, whether for standardized tests or classroom quizzes. This is where **sample math questions with answers** become invaluable.

Categorizing Example Math Problems: A Structured Approach

To make the most of example math problems, it's beneficial to categorize them by difficulty and subject matter. This allows learners to target their study effectively and gradually build their mathematical proficiency.

Elementary Mathematics: Building the Foundation

At the elementary level, the focus is on fundamental arithmetic operations and basic geometry. **Example math problems for grade 5 with answers**, for instance, would typically involve fractions, decimals, percentages, and simple geometric area calculations.

Arithmetic Examples:

1. **Addition and Subtraction:** Problem: Sarah has 15 apples and gives away 7. How many apples does she have left?
Answer: $15 - 7 = 8$ apples.
2. **Multiplication and Division:** Problem: A baker makes 6 batches of cookies, with 12 cookies in each batch. How many cookies did the baker make in total? Answer: $6 * 12 = 72$ cookies.

1. **Area of a Triangle:** Problem: A triangle has a base of 10 cm and a height of 6 cm. What is its area? Answer: Area = $(1/2) * \text{base} * \text{height} = (1/2) * 10 * 6 = 30$ sq cm.
2. **Perimeter of a Rectangle:** Problem: A rectangle has a length of 8 inches and a width of 5 inches. What is its perimeter? Answer: Perimeter = $2 * (\text{length} + \text{width}) = 2 * (8 + 5) = 2 * 13 = 26$ inches.

High School Mathematics: Algebra, Geometry, Trigonometry, and Pre-Calculus

High school mathematics introduces more abstract concepts and complex problem-solving techniques. **Example math problems with solutions for high school** cover a wide range, including quadratic equations, functions, trigonometry, and introductory calculus.

Advanced Algebra Examples:

1. **Quadratic Equations:** Problem: Solve for x : $x^2 - 5x + 6 = 0$. Answer: This can be factored: $(x - 2)(x - 3) = 0$. Therefore, $x = 2$ or $x = 3$. Alternatively, the quadratic formula can be used. These are common **quadratic equation problems with answers**.
2. **Systems of Equations:** Problem: Solve the system: $y = 2x + 1$ and $y = -x + 4$. Answer: Set the equations equal: $2x + 1 = -x + 4$. Add x to both sides: $3x + 1 = 4$. Subtract 1: $3x = 3$. Divide by 3: $x = 1$. Substitute $x=1$ into either equation to find y : $y = 2(1) + 1 = 3$. The solution is $(1, 3)$.

Trigonometry Examples:

1. **Right Triangle Trigonometry:** Problem: In a right triangle, the angle is 30 degrees, and the adjacent side is 10 units. Find the length of the hypotenuse. Answer: $\cos(30) = \text{Adjacent} / \text{Hypotenuse}$. Hypotenuse = $\text{Adjacent} / \cos(30) = 10 / (\sqrt{3}/2) = 20/\sqrt{3} \approx 11.55$ units. These are essential **trigonometry problems with solutions**.

Calculus and Beyond: Advanced Mathematical Concepts

For students tackling calculus, differential equations, and higher-level mathematics, the need for detailed, worked-out examples is paramount. **Calculus problems with step-by-step solutions** are indispensable for understanding limits, derivatives, integrals, and their applications.

Calculus Examples:

1. **Finding a Derivative:** Problem: Find the derivative of $f(x) = x^3 + 2x^2 - 5$. Answer: Using the power rule, $f'(x) = 3x^{(3-1)} + 2*2x^{(2-1)} - 0 = 3x^2 + 4x$.
2. **Calculating an Integral:** Problem: Evaluate the indefinite integral of $(2x + 3) dx$. Answer: Using the power rule for integration, the integral is $x^2 + 3x + C$, where C is the constant of integration. These are core **calculus problems with answers**.

Leveraging Example Math Problems for Effective Learning

Simply looking at example math problems and their answers is rarely enough for true comprehension. An active, strategic approach is required:

The Active Learning Strategy:

1. **Understand the Concept First:** Before attempting an example problem, ensure you grasp the underlying mathematical concept.
2. **Attempt the Problem Independently:** Cover the solution and try to solve the problem on your own. This is a critical step to gauge your understanding.
3. **Compare Your Solution:** If you get stuck, or after you've finished, compare your steps and answer with the provided solution.
4. **Analyze Discrepancies:** If your answer is incorrect, or your method differs, meticulously trace the steps in the provided solution to identify where you went wrong. Pay close attention to the logic and application of rules.
5. **Replicate the Process:** Try solving a similar problem without looking at the solution. This reinforces the learned technique.
6. **Seek Further Examples:** If a particular type of problem remains challenging, find more examples covering that specific area.

Where to Find Reliable Example Math Problems with Answers

The internet offers a vast array of resources, but quality and accuracy can vary. Here are some reliable avenues:

1. **Textbooks:** Standard math textbooks are an excellent source of curated problems with solutions, often found at the end of chapters or in a dedicated solutions manual.
2. **Educational Websites:** Websites like Khan Academy, IXL, Brilliant.org, and national educational bodies (e.g., BBC Bitesize in the UK) offer a wealth of problems with explanations.
3. **Online Forums and Q&A Sites:** Platforms like Stack Exchange (for higher mathematics) can provide explanations for specific problems, though they require careful vetting.
4. **Teacher-Provided Materials:** Educators often prepare custom examples or recommend specific online resources tailored to their curriculum.
5. **Workbooks:** Specialized workbooks designed for specific grades or subjects are a treasure trove of practice problems.

SEO Considerations and Keyword Integration

When searching for these resources, using specific keywords is crucial. Terms like "**math practice problems with answers**," "**algebra problems with solutions pdf**," "**geometry problems solved**," "**example calculus problems**," and "**word problems with answers**" will yield more targeted results. Questions & Answers About example of math problems with answers

No	Question	Answer
1	What's a common real-world math problem that uses percentages, and how do I solve it?	A common problem is calculating discounts. If an item costs \$50 and has a 20% discount, you calculate the discount amount by multiplying the original price by the percentage: $\$50 \times 0.20 = \10 . Then, subtract the discount from the original price: $\$50 - \$10 = \$40$. The final price is \$40.
2	I'm struggling with basic algebra. Can you give me a simple equation and walk through solving it?	Sure! Let's solve for 'x' in the equation $2x + 5 = 11$. First, isolate the term with 'x' by subtracting 5 from both sides: $2x + 5 - 5 = 11 - 5$, which simplifies to $2x = 6$. Next, divide both sides by 2 to find x: $2x / 2 = 6 / 2$, so $x = 3$.
3	What's a practical example of a word problem involving ratios and proportions?	Imagine a recipe calls for 2 cups of flour for every 3 eggs. If you want to use 6 eggs, how much flour do you need? Set up a proportion: (2 cups flour / 3 eggs) = (x cups flour / 6 eggs). Cross-multiply: $2 \times 6 = 3 \times x$. This gives $12 = 3x$. Divide by 3: $x = 4$. You'll need 4 cups of flour.
4	How do I calculate the area of a rectangle if I know its length and width?	The area of a rectangle is found by multiplying its length by its width. For example, if a rectangle is 8 units long and 5 units wide, its area is $8 \text{ units} \times 5 \text{ units} = 40 \text{ square units}$.
5	Can you explain a simple problem involving the Pythagorean theorem?	The Pythagorean theorem ($a^2 + b^2 = c^2$) applies to right-angled triangles. If one leg (a) is 3 units and the other leg (b) is 4 units, we find the hypotenuse (c): $3^2 + 4^2 = c^2$. This means $9 + 16 = c^2$, so $25 = c^2$. Taking the square root of both sides gives $c = 5$. The hypotenuse is 5 units long.
6	What's a common way to solve a system of linear equations?	The substitution method is common. For example, given $y = 2x + 1$ and $y = x + 3$, substitute the first equation into the second: $(2x + 1) = x + 3$. Solve for x: $2x - x = 3 - 1$, so $x = 2$. Then substitute $x = 2$ back into either original equation to find y: $y = 2(2) + 1$, so $y = 5$. The solution is (2, 5).
7	How do I find the average (mean) of a set of numbers?	To find the average, add all the numbers in the set together and then divide by the count of numbers in the set. For instance, the average of 10, 15, and 20 is $(10 + 15 + 20) / 3 = 45 / 3 = 15$.

8	Give me an example of a probability problem and its solution.	What's the probability of rolling a 4 on a standard six-sided die? There's one favorable outcome (rolling a 4) out of six possible outcomes (1, 2, 3, 4, 5, 6). So, the probability is $\frac{1}{6}$.
